ABSTRACTED-PUB-NO: US 7142900B

BASIC-ABSTRACT:

NOVELTY - The radio (10) has a radio transceiver transmitting and receiving voice communication to and from another radio. A continuous tone coded squelch system (CTCSS) controls an audio output of the transceiver, so that a user of the former radio hears certain communications transmitted over a wireless radio network. The CTCSS has an emergency CTCSS tone that enables an output of latter radio if the latter radio has been set to the same tone as the former radio. Location data for the former radio is transmitted either before or after a push-to-talk button is released when the user pushes the button.

USE - Used for communicating with another portable radio over a wireless radio network.

ADVANTAGE - The continuous tone coded squelch system (CTCSS) includes an emergency CTCSS tone that, when selected and transmitted, enables the audio output of the latter radio if the latter radio has been set to the same CTCSS tone as the former radio, thus enabling a user to hear the emergency message unless the CTCSS on their

radios is turned off or tuned into the same sub-audible tone transmitted with the emergency message. The location data for the radio is transmitted either before or after the push-to-talk button is released when the user pushes the button, so two important functions are combined into one input device, thus reducing complexity and cost of the radio, and hence resulting in the automatic transmission of location data every time the user transmits a voice communication.

DESCRIPTION OF DRAWING(S) - The drawing shows components of a global positioning system (GPS)/radio unit.

Portable radio 10
